

MyGM - Full Chat Transcript

=====

HOW DO I SEE WHOSE THE BEST TRADER, WAIVER WIRE PICKUPS, ETC

[11:00 AM]

Unfortunately ESPN Fantasy doesn't have a built-in analytics dashboard that ranks managers by trade value or waiver wire success — it's one of the biggest limitations of the platform.

What you CAN do manually:

For trades:

Go to League → Transaction Log → filter by "Trades" — you'd have to manually go through each trade and evaluate who won based on how those players performed the rest of the season. Tedious but doable.

For waiver pickups:

Filter Transaction Log by "Adds" — look at who got picked up and how they performed. Again manual but you could build a case for who found the best waiver gems.

The Moves column is your best proxy:

From the standings data you already have — high moves + good record = good wire management. Low moves + good record = good drafter who didn't need the wire (Kai's profile).

Better option — use a third party tool:

ESPN's own "grades" feature — at the end of some seasons ESPN auto-grades your draft picks and in-season moves

Fantasy Pros or FantasyNerd have league sync features that can pull your ESPN league data and give deeper analytics

Sleeper as a platform does this natively which is why a lot of serious leagues switch from ESPN

Honestly this would be a good case for switching your league to Sleeper next season — way better analytics built in.

SO ESPN DOESNT HAVE AN ADVANCED ANALYTICAL FOR EACH LEAGUE AND THEIR HISTORY SHOWING WHO THE BEST TRADER IS, WHO THE BEST TEAMS ARE, WHO THE BEST MANAGERS ARE IN THE PAST, WHO THE BEST WAIVER WIRE MANAGERS ARE, AND OVERALL RATING MANAGERS FOR THEIR MOVES. THAT NEEDS TO BE A FEATURE

[11:05 AM]

Exactly — and honestly it's a glaring gap for a platform that's been around as long as ESPN Fantasy. You'd think by now they'd have something like this.

What ESPN has is basically just the transaction log and final standings. No aggregated manager ratings, no trade grade history, no waiver wire success tracking, no multi-season manager comparisons. Nothing.

What a proper feature would look like:

Manager Profile Page:

- All time record across every season
- Championship history
- Average finish
- Best/worst season

Trade Analytics:

- Trade win/loss grade based on ROS performance of players exchanged
- Best trade ever made
- Worst trade ever made
- Overall trade rating

Waiver Wire Score:

- Best pickups by points added
- Worst drops (guys you dropped who blew up)
- Net points gained from wire activity
- Wire efficiency rating

Overall Manager Rating:

- Composite score combining draft grade, trade performance, wire management, and record
- Season by season breakdown
- Head to head historical records against each opponent

The opportunity here:

This is actually a real product gap. Sleeper is closer but still doesn't nail it. A platform or even just a tool that syncs with ESPN/Sleeper/Yahoo leagues and builds out these manager profiles would have serious demand across the 60+ million fantasy football players in the US.

HOW DO I BUILD THAT, I'M INTERESTED IN THAT
[11:05 AM]

This is actually a very buildable product and a real market gap. Here's how you'd approach it:

What you'd need technically:

ESPN's API — ESPN has an unofficial API that the fantasy community has reverse engineered. Search "ESPN Fantasy Football API Python" — there are GitHub repos that already pull league data, transaction history, rosters, scores etc. A Python library called `espn-api` on GitHub already does the heavy lifting.

The build stack:

- Backend: Python to pull and process ESPN data
- Database: Supabase to store processed data
- Frontend: React Native or React to display the dashboards
- Hosting: Vercel or Railway

The actual logic you'd build:

- For trade grades — pull both sides of every trade, compare actual points scored by those players for the rest of the season after the trade date, calculate net points gained/lost for each manager.
- For waiver wire — every add has a timestamp, pull player points scored after that date, compare to what was dropped. Net points added = wire score.
- For manager ratings — weighted composite of draft efficiency, trade grade, wire score, and record.

The real question is scope:

- A private tool just for your friend group (easiest, build it in a weekend with Nate)
- A public web app anyone can use (bigger opportunity, needs more polish)
- A full product with subscriptions (real business, needs marketing)

GIVE ME A SUMMARY OF IT SO I CAN SEND IT TO MY FRIEND JAKE

[11:06 AM]

Fantasy Football Manager Analytics is a web app that syncs with ESPN leagues and builds out a full analytics dashboard for every manager in your league. Users create a personal account, claim their teams across all past seasons, and get a composite profile that follows them across leagues and years. ESPN has 60+ million fantasy players and zero tools like this — first mover who builds it right owns the space.

ISSUE IS A LOT OF LEAGUES HAVE DIFFERING PEOPLE - SO HOW WOULD THAT WORK

[11:10 AM]

Great catch — that's actually the core technical challenge of the whole product.

The Solution — Person-Based Profiles:

When a user signs up for the platform they create a personal account and claim their teams across every season they played. Even if you were "Trey Benson" in Season 6 and "Team Justin" in Season 3, you log in, say "that was me," and the platform stitches your history together under your profile.

How it works practically:

- User signs up with ESPN login via OAuth
- Platform pulls all leagues and teams associated with that ESPN account
- If they've always used the same ESPN account, it auto-matches their history
- If there are gaps or discrepancies, they manually claim teams season by season
- Once claimed, your manager profile aggregates everything across all seasons you played

The added benefit:

This makes it more powerful — now managers who play in MULTIPLE leagues get a cross-league rating. The platform would quantify exactly this.

The real moat:

Once enough people claim their profiles and their data is in your system, you have a database of manager performance that nobody else has.

SO NOW GIVE ME A THREE SENTENCE SUMMARY

[11:11 AM]

Fantasy Football Manager Analytics is a web app that syncs with ESPN leagues and builds the advanced analytics dashboard the platform has never had — trade grades, waiver wire scores, and all-time manager ratings across every season. Users create a personal account, claim their teams across all past seasons, and get a composite profile that follows them across leagues and years. ESPN has 60+ million fantasy players and zero tools like this — first mover who builds it right owns the space.

WOULD WE PROFIT FROM IT OR JUST MAKE A PROJECT?

[11:12 AM]

You could absolutely profit from it. A few models that work:

- Freemium: Basic stats free, advanced analytics behind a \$5-10/year paywall. With 60M fantasy players even 0.1% converting is 60,000 paying users.

- One-time league fee: Charge \$1-2 per team per season. 10 person league = \$10-20, frictionless.
- Ad supported: Keep it free, run ads. Fantasy football audience is extremely valuable to advertisers — DraftKings, FanDuel, sports betting apps.

The honest answer: it starts as a project that could become a business. Build it for your league first, share it with other leagues, grow organically through word of mouth, monetize once you have real users. Same playbook as any successful consumer app.

IS THERE ANYTHING LIKE THIS?

[11:13 AM]

Yes, there are some competitors but none nail exactly what you're describing.

Closest to your idea:

- Fantasy Record Book — connects ESPN, Yahoo, and Sleeper leagues for unified league history tracking, imports complete season history, tracks head to head records, championships, and career milestones across all seasons. Most direct competitor.
- My Fantasy Analyzer — grades every trade in Sleeper leagues using dynasty values and realized points since the deal. But it's Sleeper only.
- League Legacy — automatically imports ESPN fantasy league data and tracks league history, member statistics, and compares league members head to head.

What ESPN already has:

ESPN partnered with IBM to build AI-powered Trade Grades and Waiver Grades — but these are forward-looking tools for current decisions, not historical manager performance ratings.

The gap that still exists:

None of these build a personal manager profile that follows you across leagues, years, and platforms with a composite rating of your draft, trade, and waiver wire performance over your entire fantasy career. That's your actual differentiator.

NAH LOWK NOT A PAYWALL UPFRONT

[11:14 AM]

Yeah you're right — nobody pays upfront for something they haven't used yet.

Better go-to-market: 100% free to start. Build the user base first, worry about monetization later.

How you'd actually make money once you have users:

- Ads — fantasy football audience is incredibly valuable to sports betting companies. DraftKings, FanDuel, PrizePicks would pay well.
- Sponsorships — once you have meaningful traffic, brands in the fantasy/sports space will pay for placement.
- Premium features later — once people are already using it daily and love it, a small subset will pay for extra features.

The real playbook: Build it → make it free → share with friend group → grows organically → monetize once you have real traffic.

The fantasy football community spreads tools virally when they're genuinely useful. One good post on r/fantasyfootball and you could have thousands of users overnight.

SHOULD I CONTACT JAKE?

[11:16 AM]

Yeah absolutely — this is the perfect time. You're in Colorado with nothing to do, you just had the idea, and Jake is literally the tech guy in your group who loves to code.

The pitch to Jake is clean:

- You bring the product vision and business sense
- He brings the technical execution
- It's a fun project that solves a real problem you both experience firsthand
- Low stakes to start — just build it for your own league first

The only thing to think about before you message him is equity/ownership structure if it turns into something real. Even if it starts as a fun project, worth having a casual conversation about "if this becomes something, how do we split it" before you're both deep into building.

WHAT WOULD THE COMPONENTS BE? (TRADE ANALYSIS DEPTH)

[11:19 AM]

Core Trade Analysis Engine:

At Time of Trade:

- Player rankings/value at the exact moment the trade was made
- Each manager's roster weaknesses and strengths before the trade
- Did the trade address a real need or was it just collecting talent
- Was it a fair value exchange based on ADP/rankings at that moment

Post Trade Outcomes:

- How did each player actually perform the rest of the season after the trade date
- Did the received players outperform, meet, or underperform expectations
- Net points gained or lost on each side of the trade
- Who won the trade objectively by end of season

Roster Impact Analysis:

- Did the trade actually fix the weakness it was supposed to fix
- Before trade: "Team was ranked 8th at RB, 9th at TE"
- After trade: "Team improved to 3rd at RB, 4th at TE"
- Did the improvement at those positions translate to more wins

Playoff Implications:

- Did the manager make the playoffs
- Did the traded players contribute to playoff wins or losses
- Counterfactual — would they have made playoffs without the trade
- Did they win the championship partially because of this trade

Manager Trade Profile:

- Overall trade win/loss record across all seasons
- Positions they consistently trade well vs poorly
- Are they a buy low specialist or do they always overpay
- Trade partner tendencies — who do they trade with most and who wins those deals

The Written Summary is the key feature — not just a letter grade but an actual paragraph like:
"Manager traded WR1 Davante Adams (ranked 3rd at time of trade) for TE Mark Andrews (ranked 4th) and RB Derrick Henry (ranked 7th). At time of trade, manager ranked 9th in TE and 8th in RB — clear weaknesses. Adams scored 187 points the rest of the season while Andrews and Henry combined for 312 points. Manager improved from 9th to 2nd at TE and 8th to 3rd at RB. Team made playoffs and won championship. Trade Grade: A+"

HOW WOULD WAIVER WIRES WORK?

[11:20 AM]

Core Waiver Wire Analysis Engine:

At Time of Pickup:

- Player's value/ranking at the exact moment they were added
- Who was dropped to make room for them
- Was the dropped player a mistake in hindsight
- What was the roster need at that position at that moment

Post Pickup Outcomes:

- How many points did the picked up player score from add date to end of season
- How many points did the dropped player score after being cut
- Net points gained from the transaction
- Did the pickup address a real roster need or was it a panic move

The Drop Analysis is underrated — most tools ignore what you dropped. But dropping the wrong player is just as damaging as picking up the wrong one.

Manager Waiver Profile:

- Best pickup of all time with impact score
- Worst drop of all time
- Net points gained from waiver activity across all seasons
- Are they an early bird or reactive
- FAAB efficiency if your league uses FAAB bidding

Tiered Pickup Grading:

- Tier 1 — Season Changers: Pickups that genuinely changed your season trajectory
- Tier 2 — Solid Adds: Players who filled a need and performed reasonably well
- Tier 3 — Panic Moves: Reactive adds after big one-week performances that fizzled out
- Tier 4 — Roster Churning: High volume of adds and drops with minimal net points gained

The Written Summary would look like:

"In Season 4, Levi made 48 waiver moves — 3rd most in the league. Net points gained from wire activity: +312, best in the league. Best pickup: Austin Ekeler Week 6, scored 201 points rest of season. Worst drop: Deebo Samuel Week 4, scored 178 points after being cut. Overall wire grade: B+"

KAI'S CONCERN — INJURIES AND CONTEXT

[11:22 AM]

Kai is 100% right — this is the core technical challenge. Context matters enormously.

The Problem: Player performance after a trade date is influenced by factors completely outside the manager's control:

- Teammate injuries (Tee Higgins example — blows up when Ja'Marr Chase gets hurt)
- QB changes
- Offensive coordinator changes
- Opponent schedule shifting easier/harder
- The player themselves getting injured

How You Account For It:

Expected Points Model:

Instead of just tracking raw points scored, you compare actual points to expected points based on pre-existing projections at the time of the trade. If Tee Higgins was projected for 800 points but scored 1200 because Chase got hurt, the system flags that as an outlier driven by external factors.

Context Flags:

Every transaction gets automatically tagged with relevant events that happened after the trade:

-  Teammate injury (Chase went down Week 8)
-  QB change (starter benched)
-  Player injury
-  Clean performance — no major context changes

Grade with asterisk when context significantly impacted the outcome. You're not claiming to be perfectly objective — you're claiming to give more context than anyone else does.

V1 Simplification:

- Raw points scored after trade date
- Simple injury flags pulled from NFL injury data
- A disclaimer that grades are context-dependent
- Let users manually add notes to trades

The fact that Kai is thinking about edge cases means he's engaged. His concern isn't a reason not to build it — it's a feature request.

HOW DIFFICULT WOULD IT BE TO CODE THIS?

[11:24 AM]

The Easy Parts:

- Pulling ESPN league data via the unofficial API — relatively straightforward, Python libraries exist
- Displaying standings, historical records, manager profiles — standard web dev
- Basic transaction log — just reading existing ESPN data

The Medium Difficulty Parts:

- Building the manager profile system with cross-season identity matching
- Calculating net points gained from waiver wire transactions
- Basic trade grade based on raw points scored after trade date
- Frontend dashboard displaying everything cleanly

The Hard Parts:

- Expected points model — need historical projection data at specific points in time
- Context flagging — automatically detecting teammate injuries and correlating with performance
- Playoff implication modeling — running counterfactual simulations is genuinely complex
- Accounting for Kai's concern properly — requires machine learning level sophistication

A V1 with basic features — Jake could probably build in a few weeks to a couple months.
A fully sophisticated version — that's a 6-12 month serious engineering project.

Smart approach: Build V1 simple and fast. Get real users. See what they actually want. Then build the sophisticated stuff based on real feedback.

JAKE IS AN AWESOME CODER
[11:24 AM]

Then the timeline gets a lot more aggressive.

V1 could be done in 2-4 weeks:

- ESPN API integration
- Manager profiles with cross-season history
- Basic standings and historical records
- Raw transaction tracking
- Simple trade grades based on points scored after trade date
- Clean dashboard UI

V2 over the following 1-2 months:

- Expected points model
- Injury context flags
- Waiver wire efficiency scores
- Manager composite ratings
- Cross league profiles

Timing is perfect: NFL season starts September — you have roughly 2-3 months to build V1, test it with your league, fix bugs, and have something ready to share wider when the season kicks off.

WHAT IF WE EXPAND TO FANTASY BASEBALL, BASKETBALL, SOCCER?
[11:39 AM]

Now you're thinking bigger — and that changes the whole calculus.

The core problem you're solving isn't NFL-specific. The same gap exists in baseball, basketball, soccer, hockey. You build the engine once and apply it to every sport.

What this does to the business:

- Solves the seasonality problem completely — always have an active user base
- Total addressable market explodes
- Makes the manager profile genuinely powerful — composite rating reflects how you perform across ALL sports
- Much harder for a competitor to replicate

The cross-sport manager profile becomes the real product:

"Kai Hooks — Career Fantasy Rating: 94/100. NFL: top 3 three consecutive years. NBA: 2 championships in 4 seasons. MLB: consistently top half. Overall trade grade: A-. Waiver wire efficiency: top 10% across all leagues."

Revised build order:

1. NFL first — biggest market, proves the concept
2. NBA second — Sleeper has strong NBA presence
3. MLB third — Yahoo dominates here
4. Soccer/hockey — smaller fantasy markets but adds completeness

MyGM

[11:40 AM]

That's a great name.

Why it works:

- GM is universally understood across every sport — General Manager is exactly what a fantasy manager is
- "My" makes it personal — your profile, your history, your rating
- Short, clean, memorable, easy to say and spell
- Works across every sport without being sport-specific
- Has natural branding potential — "What's your GM rating?" becomes a thing people say

The tagline writes itself:

"Every GM has a history. Now yours has a record."

The domain is probably available — MyGM.com or MyGM.gg (.gg domain is huge in gaming/fantasy communities)

Competitive positioning: Every fantasy platform calls you a "manager" or "owner." MyGM reframes it as something more serious — you're a General Manager with a track record, a rating, a legacy.

IS MyGM TRADEMARKED?

[11:47 AM]

No direct USPTO result found for "MyGM" in fantasy sports or tech. But check yourself: Go to tmsearch.uspto.gov → search "MyGM" → filter by Class 41 (entertainment/sports) and Class 42 (software/tech).

The bigger concern: "MyGM" contains "GM" which is also General Motors' core trademark. General Motors is extremely aggressive about protecting "GM." That's a real legal risk worth thinking about.

Safer alternatives if MyGM is problematic:

- StatGM
- LeagueGrade
- ManagerIQ
- FranchiseScore
- DraftLegacy

HOW MANY PEOPLE PLAY FANTASY SPORTS?

[11:44 AM]

Sport	US Players	Global Opportunity
NFL Fantasy	~47M	Primarily US
NBA Fantasy	~20M	Growing globally
MLB Fantasy	~15M	Primarily US
Soccer Fantasy	~6M US	Massive globally (100M+)
Total US	~53M	245M globally

Global fantasy sports market reached ~\$42B in 2026, projected to reach \$80B by 2031.

HOW MANY FEATURES DOES SLEEPER HAVE OF THIS?

[11:48 AM]

What Sleeper HAS:

- League standings and history within a single league
- Basic transaction log
- Forward-looking trade analyzer (evaluates proposed trades BEFORE you make them)
- Waiver wire countdown
- League chat and social features
- Live scoring and play-by-play
- Mock draft tool

What Sleeper does NOT have:

- Historical trade grades based on actual outcomes after the trade
- Waiver wire performance tracking (net points gained/lost)
- Drop regret score
- Manager composite rating
- Cross-season manager profiles
- Cross-league manager identity
- Cross-sport GM profile
- Context flags on trades (injury adjustments)
- Any kind of "who is the best GM" analytics

Bottom line: Sleeper has ZERO of the core MyGM features. The gap is real and wide open.

3-SENTENCE SUMMARY

[12:09 PM]

MyGM is a web app that connects to ESPN, Yahoo, and Sleeper across all major fantasy sports and builds the analytics dashboard that no platform has ever provided — grading every historical trade by actual outcomes, tracking waiver wire performance by net points gained, and rating every manager with a composite score. Your MyGM profile follows you across every league, every season, and every sport, so for the first time you have a permanent record that answers the question every fantasy player argues about: who actually runs the best team. With 245 million fantasy sports players globally and zero tools that do this, MyGM is the missing layer between playing fantasy sports and truly knowing how good you are at it.

CAN YOU EVEN GET ALL THE DATA IN THE FIRST PLACE?

[12:09 PM]

Sleeper — easiest, most open:

Sleeper has a fully public, well documented API that requires zero authentication. You can pull league history, all transactions, rosters, scores, everything. Best starting point.

ESPN — trickier but doable:

No official public API but the fantasy community has reverse engineered it. The `espn-api` Python library works widely — but requires users to provide ESPN credentials or cookies. ESPN could theoretically break it at any time by changing their backend. Real risk.

Yahoo — has an official API:

Yahoo actually has an official Fantasy Sports API with proper OAuth. More reliable since it's officially supported.

How you mitigate it:

- Build on Sleeper first since the API is rock solid
- Use Yahoo's official API for baseball
- For ESPN, have users connect via OAuth cookie method and be transparent it could break
- Long term, negotiate official data partnerships directly with ESPN and Yahoo

HOW TO BUILD IT (FOR JAKE)

[12:19 PM]

Start by hitting the Sleeper API since it's fully public and requires zero authentication — pull every league, every transaction, every matchup, and every player stat for every week going back as many seasons as the API allows, and dump all of it raw into Supabase immediately without processing it yet.

Once the data is in, build the trade grading engine: for every trade, grab the exact week it happened, identify which players went to which manager, sum up the points those players scored from that week to the end of the season, calculate the net difference between both sides, and assign a letter grade based on that number.

Do the same thing for waiver wire moves — for every add, track how many points that player scored after being picked up, and for every drop, track how many points that player scored after being cut, then calculate the net points gained or lost from each transaction.

Once you have trade grades and waiver scores for every manager, aggregate them into a composite GM rating weighted roughly one third each between trade performance, waiver wire efficiency, and all-time win percentage, normalized to a score out of 100.

Finally build a simple React frontend with three core pages — a manager profile showing their GM rating, trade history, and waiver scores; a league leaderboard ranking all managers; and an individual trade breakdown page — deploy the backend on Railway and the frontend on Vercel, and test the whole thing with your league before touching ESPN or Yahoo.

FULL VERSION 1 SCOPE

[12:22 PM]

What V1 Is:

A web app that connects to your ESPN league, pulls your full historical data, and shows every manager's all-time record, every trade graded by actual points scored after the trade date, every waiver wire move graded by net points gained, and a composite GM rating for every manager in the league.

What V1 Is NOT:

- No context flags or injury adjustments (V2)
- No cross-sport profiles (V2)
- No Yahoo or Sleeper integration (V2)
- No playoff implication modeling (V2)
- No expected points model (V2)
- No mobile app (V2)

Core Pages:

1. Landing Page — Connect ESPN league button, enter League ID + cookies
2. League Dashboard — All managers ranked by GM Rating with columns for record, championships, trade grade, waiver score
3. Manager Profile Page — GM Rating out of 100, all-time record, championship history, trade history, waiver wire score
4. Trade Breakdown Page — Both sides of trade, points scored after trade date, net difference, letter grade A+ to F
5. Waiver Wire Page — Every add/drop, net points per transaction, best pickup and worst drop all-time

GM Rating Formula (V1):

- 35% Trade performance (average net points per trade)
- 35% Waiver wire efficiency (total net points from wire activity)
- 30% All-time win percentage
- Normalized to score out of 100

Tech Stack:

- Data: ESPN unofficial API via espn-api Python library
- Backend: Python + FastAPI
- Database: Supabase
- Frontend: React + Tailwind
- Hosting: Vercel (frontend) + Railway (Python backend)

Build Timeline:

- Day 1-2: Test ESPN API, confirm how far back transaction history goes, store everything raw in Supabase
- Day 3-4: Build trade grading engine
- Day 4-5: Build waiver wire engine
- Day 5: Build composite GM rating
- Day 6-7: Build React frontend
- Day 7: Test with your league, share with group chat, get feedback

Success Criteria for V1:

- ESPN data pulls clean going back at least 3 seasons
- Trade grades feel accurate when you look at your own league history
- Everyone in the group chat looks up their GM rating immediately
- At least one person says "this is actually sick"

WHAT IS V2?

[12:23 PM]

1. Context Flags on Trades — Pull historical NFL injury data, tag every trade with relevant events, adjust grades accordingly. Solves the Kai concern.
2. ESPN OAuth Flow — Proper login that handles cookies automatically instead of users grabbing them manually.
3. Sleeper and Yahoo Integration — Opens up the full fantasy sports market.
4. Manager Identity Layer — Permanent MyGM account, claim teams across every season and platform, one unified profile.
5. Cross-League Leaderboards — Rank managers against each other not just within one league but across all leagues on the platform.
6. Expected Points Model — Compare actual performance to projections at time of trade, not just raw points.
7. NBA and MLB Expansion — Apply the same engine to fantasy basketball and baseball. Solves seasonality.
8. Shareable Profile Links — mygm.gg/kai or mygm.gg/levi. This is your organic growth engine.
9. Weekly Power Rankings — Auto-generated every Tuesday, keeps people coming back mid-season.

10. Mobile App — React Native for iOS and Android.

ALL THE WORK IS FIGURING OUT WHERE THE DATA COMES FROM — JAKE'S CONCERN

[12:25 PM]

Jake is 100% right. Here's the full data problem:

1. League and Transaction History (trades, adds, drops)
 - ESPN: Unofficial API, unknown how far back it goes
 - Sleeper: Fully public API, reliable, goes back to league inception
 - Yahoo: Official API with OAuth
2. Player Points Scored by Week (what makes trade grading possible)
 - ESPN: Available but reliability unknown
 - Sleeper: Has a stats endpoint for player points by week — cleanest option
 - Yahoo: Available through official API
3. Historical Player Rankings and ADP (needed for V2 expected points model)
 - NOT available on any fantasy platform directly
 - FantasyPros has historical ADP data going back multiple seasons — best free source
4. Historical NFL Injury Data (needed for V2 context flags)
 - NOT available through ESPN, Sleeper, or Yahoo
 - Would need Sportradar, SportsData.io, or Pro Football Reference
5. Player Identity Mapping (cross-platform player IDs)
 - Sleeper publishes a master player database that maps IDs across platforms — good starting point

The single most important test before writing any product code:

Can you pull every transaction from your ESPN league going back to Season 1, and can you match every player to their week by week point totals?

Test it first:

```
from espn_api.football import League
```

```
# Test 1 - pull transactions going back
```

```
league_2021 = League(league_id=YOUR_ID, year=2021, espn_s2='X', swid='Y')
```

```
print(league_2021.recent_activity(size=100))
```

```
# Test 2 - pull player stats  
box_scores = league_2021.box_scores(week=1)  
print(box_scores)
```

If both return clean data going back multiple seasons, you're good to build. If not, you know exactly what to solve before writing a single line of product code. That one day of testing saves weeks of building on a broken foundation.
